Definition Let Γ be a group and let $g_1, \ldots, g_n \in \Gamma$, $\varepsilon_1, \ldots, \varepsilon_n \in \mathbb{Z}$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Definition

Let Γ be a group and let $g_1, \ldots, g_n \in \Gamma$, $\varepsilon_1, \ldots, \varepsilon_n \in \mathbb{Z}$. We say that the equation

$$w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$$

has a solution in Γ if there exists $h \in \Gamma$ such that w(h) = e.

Definition

Let Γ be a group and let $g_1, \ldots, g_n \in \Gamma$, $\varepsilon_1, \ldots, \varepsilon_n \in \mathbb{Z}$. We say that the equation

$$w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$$

has a solution in Γ if there exists $h \in \Gamma$ such that w(h) = e.

The equation has a solution **over** Γ if there is an extension $\Gamma \leq \Lambda$ and there is some $h \in \Lambda$ such that w(h) = e in Λ .

Definition

Let Γ be a group and let $g_1, \ldots, g_n \in \Gamma$, $\varepsilon_1, \ldots, \varepsilon_n \in \mathbb{Z}$. We say that the equation

$$w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$$

has a solution in Γ if there exists $h \in \Gamma$ such that w(h) = e.

The equation has a solution **over** Γ if there is an extension $\Gamma \leq \Lambda$ and there is some $h \in \Lambda$ such that w(h) = e in Λ .

The study of equations like this goes back to:

Bernhard H. Neumann, *Adjunction of elements to groups*, J. London Math. Soc. 18 (1943), 411.

If $a, b \in \Gamma$, then $w(t) = atbt^{-1}$ cannot be solved over Γ unless the orders of a and b agree.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

If $a, b \in \Gamma$, then $w(t) = atbt^{-1}$ cannot be solved over Γ unless the orders of a and b agree.

Indeed, if such a t exists, then

$$a^{-1} = tbt^{-1}$$
.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

If $a, b \in \Gamma$, then $w(t) = atbt^{-1}$ cannot be solved over Γ unless the orders of a and b agree.

Indeed, if such a t exists, then

$$a^{-1} = tbt^{-1}.$$

Example

The equation $w(t) = tat^{-1}ata^{-1}t^{-1}a^{-2}$ cannot be solved over $\mathbb{Z}/p\mathbb{Z} = \langle a \rangle$.

If $a, b \in \Gamma$, then $w(t) = atbt^{-1}$ cannot be solved over Γ unless the orders of a and b agree.

Indeed, if such a t exists, then

$$a^{-1} = tbt^{-1}.$$

Example

The equation $w(t) = tat^{-1}ata^{-1}t^{-1}a^{-2}$ cannot be solved over $\mathbb{Z}/p\mathbb{Z} = \langle a \rangle$.

Indeed, if w(t) = 1, then

$$a^2 = (tat^{-1})a(tat^{-1})^{-1}$$

and a conjugate of a (namely tat^{-1}) would conjugate a to a^2 .

If $a, b \in \Gamma$, then $w(t) = atbt^{-1}$ cannot be solved over Γ unless the orders of a and b agree.

Indeed, if such a t exists, then

$$a^{-1} = tbt^{-1}.$$

Example

The equation $w(t) = tat^{-1}ata^{-1}t^{-1}a^{-2}$ cannot be solved over $\mathbb{Z}/p\mathbb{Z} = \langle a \rangle$.

Indeed, if w(t) = 1, then

$$a^2 = (tat^{-1})a(tat^{-1})^{-1}$$

and a conjugate of *a* (namely tat^{-1}) would conjugate *a* to a^2 . But the automorphism of $\mathbb{Z}/p\mathbb{Z}$ which sends 1 to 2 has order dividing p-1 and hence the order is co-prime to *p*.

We say that the equation $w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$ is non-singular if $\sum_{i=1}^n \varepsilon_i \neq 0$.

We say that the equation $w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$ is non-singular if $\sum_{i=1}^n \varepsilon_i \neq 0$. It is called non-trivial if it is not conjugate to $w(t) = g \neq 1$.

We say that the equation $w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$ is non-singular if $\sum_{i=1}^n \varepsilon_i \neq 0$. It is called non-trivial if it is not conjugate to $w(t) = g \neq 1$.

Conjecture (Levin)

Any non-trivial equation can be solved over Γ , if Γ is torsionfree.

We say that the equation $w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$ is non-singular if $\sum_{i=1}^n \varepsilon_i \neq 0$. It is called non-trivial if it is not conjugate to $w(t) = g \neq 1$.

Conjecture (Levin)

Any non-trivial equation can be solved over Γ , if Γ is torsionfree.

Conjecture (Kervaire-Laudenbach)

If w(t) is non-singular, then w(t) has a solution over Γ .

We say that the equation $w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$ is non-singular if $\sum_{i=1}^n \varepsilon_i \neq 0$. It is called non-trivial if it is not conjugate to $w(t) = g \neq 1$.

Conjecture (Levin)

Any non-trivial equation can be solved over Γ , if Γ is torsionfree.

Conjecture (Kervaire-Laudenbach)

If w(t) is non-singular, then w(t) has a solution over Γ .

Theorem (Klyachko)

If Γ is torsionfree and w(t) is non-singular, then w(t) can be solved over Γ .

Anton A. Klyachko, *A funny property of sphere and equations over groups*, Comm. Algebra 21 (1993), no. 7, 2555–2575.

We say that the equation $w(t) = g_1 t^{\varepsilon_1} g_2 t^{\varepsilon_2} g_3 \dots g_n t^{\varepsilon_n}$ is non-singular if $\sum_{i=1}^n \varepsilon_i \neq 0$. It is called non-trivial if it is not conjugate to $w(t) = g \neq 1$.

Conjecture (Levin)

Any non-trivial equation can be solved over Γ , if Γ is torsionfree.

Conjecture (Kervaire-Laudenbach)

If w(t) is non-singular, then w(t) has a solution over Γ .

Theorem (Klyachko)

If Γ is torsionfree and w(t) is non-singular, then w(t) can be solved over Γ .

Anton A. Klyachko, *A funny property of sphere and equations over groups*, Comm. Algebra 21 (1993), no. 7, 2555–2575.

We will focus on the second conjecture.

The Kervaire-Laudenbach conjecture was motivated originally from 3-dimensional topology, where certain geometric operations on knot complements amount to the attachment of an "arc" and a "disc".

The resulting effect on fundamental groups is exactly

$$\Gamma \rightsquigarrow rac{\Gamma * \langle t
angle}{\langle\!\langle w(t)
angle\!
angle}.$$

Theorem (Gerstenhaber-Rothaus, 1962) Any non-singular equation in U(n) can be solved in U(n).

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Theorem (Gerstenhaber-Rothaus, 1962) Any non-singular equation in U(n) can be solved in U(n).

Proof.

Consider the word map $w \colon U(n) \to U(n), w(t) = g_1 t^{\varepsilon_1} \dots g_n t^{\varepsilon_n}$.

Theorem (Gerstenhaber-Rothaus, 1962)

Any non-singular equation in U(n) can be solved in U(n).

Proof.

Consider the word map $w: U(n) \to U(n)$, $w(t) = g_1 t^{\varepsilon_1} \dots g_n t^{\varepsilon_n}$. Since U(n) is connected, each g_i can be moved continuously to 1_n .

Theorem (Gerstenhaber-Rothaus, 1962)

Any non-singular equation in U(n) can be solved in U(n).

Proof.

Consider the word map $w: U(n) \to U(n)$, $w(t) = g_1 t^{\varepsilon_1} \dots g_n t^{\varepsilon_n}$. Since U(n) is connected, each g_i can be moved continuously to 1_n . Thus, this map is homotopic to $t \mapsto t^{\sum_i \varepsilon_i}$,

Theorem (Gerstenhaber-Rothaus, 1962)

Any non-singular equation in U(n) can be solved in U(n).

Proof.

Consider the word map $w: U(n) \to U(n)$, $w(t) = g_1 t^{\varepsilon_1} \dots g_n t^{\varepsilon_n}$. Since U(n) is connected, each g_i can be moved continuously to 1_n . Thus, this map is homotopic to $t \mapsto t^{\sum_i \varepsilon_i}$, which has non-trivial degree as a map of topological manifolds.

Theorem (Gerstenhaber-Rothaus, 1962)

Any non-singular equation in U(n) can be solved in U(n).

Proof.

Consider the word map $w: U(n) \to U(n), w(t) = g_1 t^{\varepsilon_1} \dots g_n t^{\varepsilon_n}$. Since U(n) is connected, each g_i can be moved continuously to 1_n . Thus, this map is homotopic to $t \mapsto t^{\sum_i \varepsilon_i}$, which has non-trivial degree as a map of topological manifolds. Indeed, a generic matrix has exactly d^n preimages with $d := |\sum_i \varepsilon_i|$.

Topological methods

Theorem (Gerstenhaber-Rothaus, 1962)

Any non-singular equation in U(n) can be solved in U(n).

Proof.

Consider the word map $w: U(n) \to U(n), w(t) = g_1 t^{\varepsilon_1} \dots g_n t^{\varepsilon_n}$. Since U(n) is connected, each g_i can be moved continuously to 1_n . Thus, this map is homotopic to $t \mapsto t^{\sum_i \varepsilon_i}$, which has non-trivial degree as a map of topological manifolds. Indeed, a generic matrix has exactly d^n preimages with $d := |\sum_i \varepsilon_i|$. Hence, the map w must be surjective.

Topological methods

Proof.

Embed Γ in U(n), solve the equation there to get a solution u. Now, $\Lambda = \langle \Gamma, u \rangle \subset U(n)$ is residually finite my Mal'cev's theorem. Thus, there exists a finite quotient of Λ which contains Γ .

The same holds for locally residually finite groups, but the general situation remained unclear back in the 60s.

Any non-singular equation with coefficients in a finite group Γ can be solved over Γ . In fact, they can be solved in a finite extension $\Gamma \leq \Lambda$.

Proof.

Embed Γ in U(n), solve the equation there to get a solution u. Now, $\Lambda = \langle \Gamma, u \rangle \subset U(n)$ is residually finite my Mal'cev's theorem. Thus, there exists a finite quotient of Λ which contains Γ .

The same holds for locally residually finite groups, but the general situation remained unclear back in the 60s.

We say that Γ is algebraically closed if any non-singular equation has a solution in $\Gamma.$

We say that Γ is algebraically closed if any non-singular equation has a solution in $\Gamma.$

Proposition

The class of algebraically closed groups is closed under products and quotients.

We say that Γ is algebraically closed if any non-singular equation has a solution in $\Gamma.$

Proposition

The class of algebraically closed groups is closed under products and quotients.

Corollary (Pestov)

Any group Γ that embeds into an abstract quotient of $\prod_n U(n)$ (these are called **hyperlinear**) satisfies Kervaire's Conjecture.

We say that Γ is algebraically closed if any non-singular equation has a solution in $\Gamma.$

Proposition

The class of algebraically closed groups is closed under products and quotients.

Corollary (Pestov)

Any group Γ that embeds into an abstract quotient of $\prod_n U(n)$ (these are called **hyperlinear**) satisfies Kervaire's Conjecture.

Remark

Every **sofic** group can be embedded into a quotient of $\prod_n U(n)$.

Let Sym(n) be the permutation group on n letters. We set:

$$d(\sigma,\tau) = \frac{1}{n} \cdot |\{i \in \{0,...,n\} \mid \sigma(i) \neq \tau(i)\}|$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

to be the normalized Hamming distance on permutations $\sigma, \tau \in \text{Sym}(n)$.

Conjecture

If $w \in \Gamma * \mathbb{F}_n$ is non-singular, then w has a solution over Γ .

Theorem (with Anton Klyachko)

If $w \in \Gamma * \mathbb{F}_2$ satisfies $\varepsilon(w) \notin [[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ and Γ is hyperlinear, then w has a solution over Γ .

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Instead of degree theory, we are making use of the cohomology ring of SU(p) and PU(p).

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Instead of degree theory, we are making use of the cohomology ring of SU(p) and PU(p). The key insight is:

1. The commutator map $c : PU(p)^{\times 2} \to PU(p)$ lifts to SU(p).

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Instead of degree theory, we are making use of the cohomology ring of SU(p) and PU(p). The key insight is:

1. The commutator map $c: PU(p)^{\times 2} \to PU(p)$ lifts to SU(p). (Indeed, the analogous commutator map $c: SU(p)^{\times 2} \to SU(p)$ factorized through $PU(p)^{\times 2}$.)

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Instead of degree theory, we are making use of the cohomology ring of SU(p) and PU(p). The key insight is:

1. The commutator map $c: PU(p)^{\times 2} \to PU(p)$ lifts to SU(p). (Indeed, the analogous commutator map $c: SU(p)^{\times 2} \to SU(p)$ factorized through $PU(p)^{\times 2}$.)

2. The generator of the top-dimensional cohomology group $H^*(SU(p), \mathbb{Z}/p\mathbb{Z})$ is mapped non-trivially to

 $H^*(PU(p)^{\times 2}, \mathbb{Z}/p\mathbb{Z})$

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Instead of degree theory, we are making use of the cohomology ring of SU(p) and PU(p). The key insight is:

- 1. The commutator map $c: PU(p)^{\times 2} \to PU(p)$ lifts to SU(p). (Indeed, the analogous commutator map $c: SU(p)^{\times 2} \to SU(p)$ factorized through $PU(p)^{\times 2}$.)
- 2. The generator of the top-dimensional cohomology group $H^*(SU(p), \mathbb{Z}/p\mathbb{Z})$ is mapped non-trivially to

 $H^*(PU(p)^{\times 2}, \mathbb{Z}/p\mathbb{Z}) \cong H^*(PU(p), \mathbb{Z}/p\mathbb{Z}) \otimes H^*(PU(p), \mathbb{Z}/p\mathbb{Z}).$

Let p be prime. Any $w \in SU(p) * \mathbb{F}_2$ with $\varepsilon(w) \notin \mathbb{F}_2^p[[\mathbb{F}_2, \mathbb{F}_2], \mathbb{F}_2]$ can be solved in SU(p).

Instead of degree theory, we are making use of the cohomology ring of SU(p) and PU(p). The key insight is:

- 2. The generator of the top-dimensional cohomology group $H^*(SU(p), \mathbb{Z}/p\mathbb{Z})$ is mapped non-trivially to

 $H^*(PU(p)^{\times 2}, \mathbb{Z}/p\mathbb{Z}) \cong H^*(PU(p), \mathbb{Z}/p\mathbb{Z}) \otimes H^*(PU(p), \mathbb{Z}/p\mathbb{Z}).$

3. Thus, $c: PU(p)^{\times 2} \to SU(p)$ is not homotopic to a non-surjective map.

Theorem (Borel)

$$H^*(SU(n),\mathbb{Z}/p\mathbb{Z}) = \Lambda^*_{\mathbb{Z}/p\mathbb{Z}}(x_2,x_3,\ldots,x_n)$$
 with $|x_i| = 2i - 1$ and

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Theorem (Borel)

$$H^*(SU(n),\mathbb{Z}/p\mathbb{Z}) = \Lambda^*_{\mathbb{Z}/p\mathbb{Z}}(x_2,x_3,\ldots,x_n)$$
 with $|x_i| = 2i-1$ and

$$\Delta(x_i) = x_i \otimes 1 + 1 \otimes x_i.$$

Let p be an odd prime number. Then,

 $H^*(PU(p), \mathbb{Z}/p\mathbb{Z}) \cong (\mathbb{Z}/p\mathbb{Z})[y]/(y^p) \otimes_{\mathbb{Z}} \Lambda^*_{\mathbb{Z}/p\mathbb{Z}}(y_1, y_2, \dots, y_{p-1})$ with |y| = 2, $|y_i| = 2i - 1$.

Let p be an odd prime number. Then,

$$\begin{split} H^*(PU(p),\mathbb{Z}/p\mathbb{Z}) &\cong (\mathbb{Z}/p\mathbb{Z})[y]/(y^p) \otimes_{\mathbb{Z}} \Lambda^*_{\mathbb{Z}/p\mathbb{Z}}(y_1, y_2, \dots, y_{p-1}) \\ \text{with } |y| &= 2, \ |y_i| = 2i-1. \ \text{The co-multiplication takes the form} \\ \Delta(y) &= y \otimes 1 + 1 \otimes y, \end{split}$$

and

Let p be an odd prime number. Then,

$$\begin{split} H^*(PU(p),\mathbb{Z}/p\mathbb{Z}) &\cong (\mathbb{Z}/p\mathbb{Z})[y]/(y^p) \otimes_{\mathbb{Z}} \Lambda^*_{\mathbb{Z}/p\mathbb{Z}}(y_1, y_2, \dots, y_{p-1}) \\ \text{with } |y| = 2, \ |y_i| = 2i-1. \ \text{The co-multiplication takes the form} \\ \Delta(y) &= y \otimes 1 + 1 \otimes y, \end{split}$$

and

$$\Delta(y_i) = y_i \otimes 1 + 1 \otimes y_i + \sum_{j=1}^{i-1} {j-1 \choose i-1} \cdot y_j \otimes y^{i-j}.$$

Let p be an odd prime number. Then,

 $\begin{aligned} H^*(PU(p),\mathbb{Z}/p\mathbb{Z}) &\cong (\mathbb{Z}/p\mathbb{Z})[y]/(y^p) \otimes_{\mathbb{Z}} \Lambda^*_{\mathbb{Z}/p\mathbb{Z}}(y_1, y_2, \dots, y_{p-1}) \\ \text{with } |y| &= 2, \ |y_i| = 2i-1. \ \text{The co-multiplication takes the form} \\ \Delta(y) &= y \otimes 1 + 1 \otimes y, \end{aligned}$

and

$$\Delta(y_i) = y_i \otimes 1 + 1 \otimes y_i + \sum_{j=1}^{i-1} {j-1 \choose i-1} \cdot y_j \otimes y^{i-j}.$$

In particular, the co-multiplication is not co-commutative.

For $w \in F_2 \setminus \{1\}$, what about the equation

$$w(s,t)=g ?$$
